

No Hardware. No Software. No Hassles.

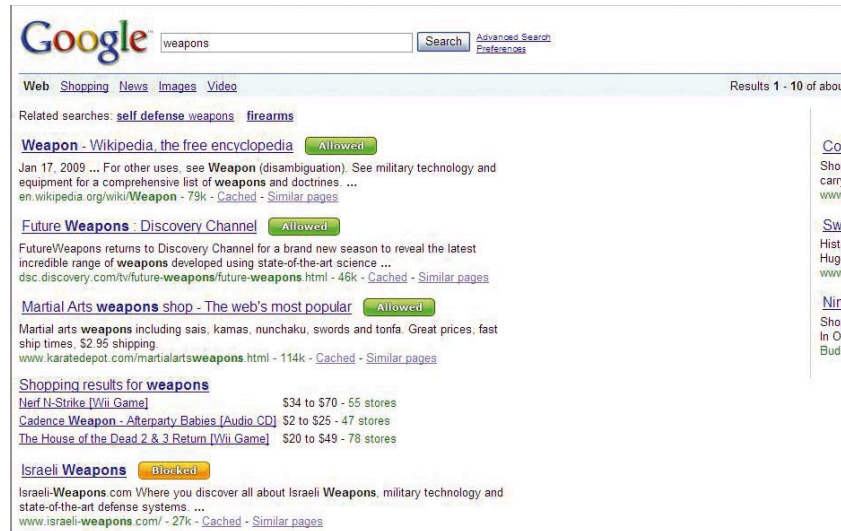

Webroot® Web Security SaaS (Software-as-a-Service) provides proactive Web security that blocks threats in the cloud — before they ever reach your network. With no hardware or software to manage, a lower total cost of ownership and better protection against viruses, spyware, phishing attacks and inappropriate online usage, this comprehensive solution can replace or enhance a company’s existing security infrastructure. Because software as a service is highly flexible, companies are able to scale services based on their unique needs, thereby helping to manage company growth. Webroot Web Security SaaS also extends seamless protection to mobile users, providing increased productivity as well as better overall security.

Reliable Service	<ul style="list-style-type: none"> Service Level Agreements (SLAs) ensure performance 99.99% Uptime guarantee Fault-tolerant data centers eliminate single point-of-failure risk Service, security and support is provided by a global security leader

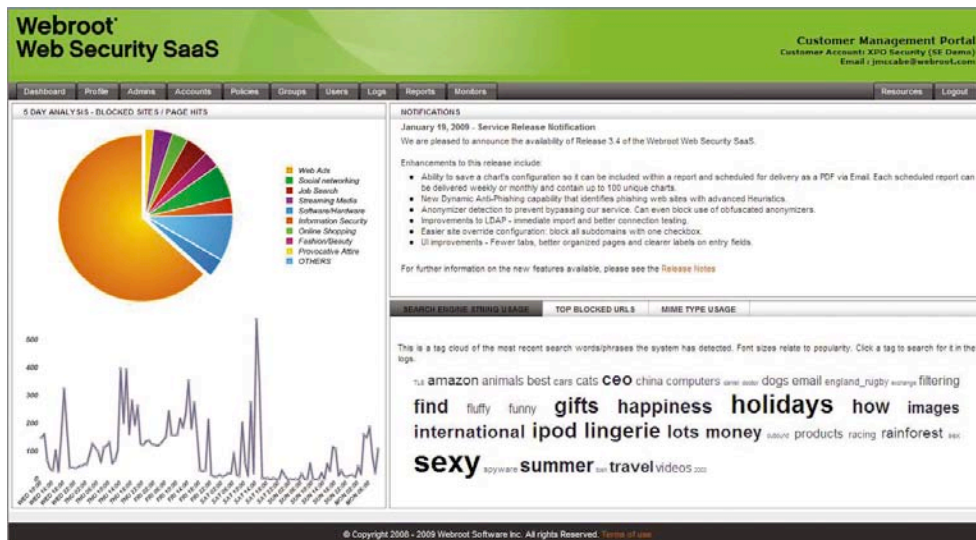

Enhanced Policy Enforcement

With anonymizer and proxy bypass detection, Internet usage policies will be enforced despite user attempts to access a previously blocked page through common or custom 'Anonymizer' sites. Webroot also provides a unique 'Scan Ahead' technology that examines all search engine queries and returns color-coded search page results based on the requestor's Internet access policy. This feature not only helps enforce Internet use policy, but it also proactively mitigates Internet threats and harmful content.

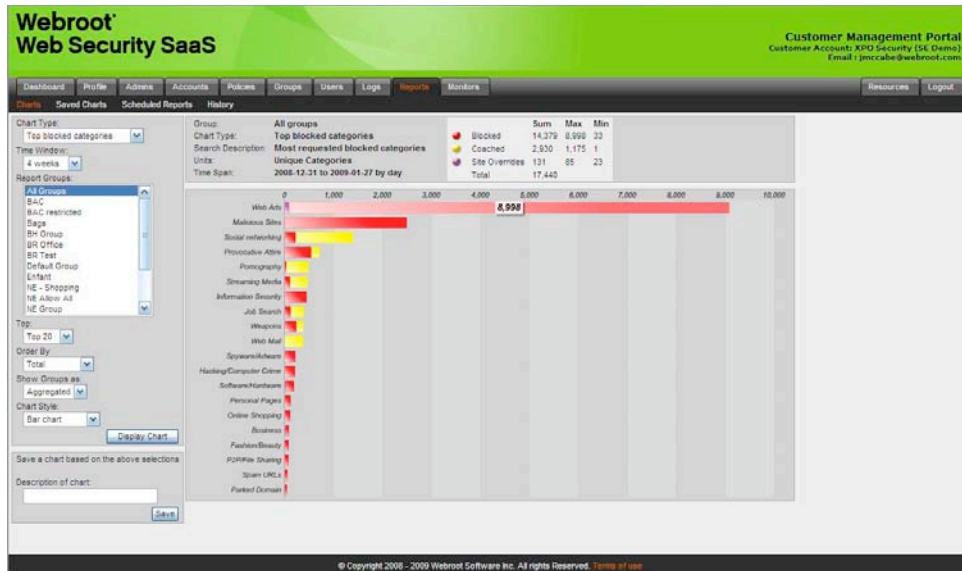

Intuitive Management Console

Manage company Internet use and security policies via an intuitive web-based management console. Administrators can securely access Webroot's powerful rules engine to facilitate user, group and account level access policies. A real-time web traffic summary dashboard displays company website access by category and popular search terms.

Real-Time Logging and Reporting

Real-time logs display which sites and downloads users have attempted to access and whether or not they were allowed. Detailed reports can be run ad-hoc or scheduled, allowing companies to accurately monitor Internet use by viewing graphs on web traffic trends, top blocked URLs, blocked malware, bandwidth use and more. Scheduled reports can contain up to 100 separate charts for maximum visibility into company and user Internet use.

Roaming User Protection

Webroot Web Security SaaS provides seamless enforcement of company Internet use policies regardless of where an employee is working – whether it's at home, the airport, a hotel or an Internet café. Mobile laptop users receive automatic and uninterrupted protection even while they are outside their organization's network. Because the Webroot service sits in-the-cloud, laptop users can authenticate directly with the service rather than establishing a VPN connection to the corporate network. This roaming user protection improves employee productivity and enhances network security.

Fast Deployment and Guaranteed Service Availability

Customer deployment can typically be complete in less than one week and there are no costly hardware, software, or equipment maintenance fees. Webroot also guarantees 99.99% service availability to ensure that customers have consistent, reliable access to a secure web communications environment.

Webroot – A Global Leader in Security

Webroot is a global company with a history of delivering innovative security solutions to millions of businesses and consumers. Our best-of-breed technology has won numerous awards and our SaaS solutions protect over three million users worldwide. As one of the largest privately held companies in the Security SaaS market, Webroot has multiple data centers and support offices across the US, UK, EMEA, Japan and Australia. To guarantee the highest level of service, all Webroot Security SaaS solutions are backed by local technical support teams and Service Level Agreements (SLAs) that are among the best in the business.
